Manoj Baghel(2415000943)

Under the Guidance of:-

Mr. Pankaj Kapoor

1. Introduction

Campus Connect is a mobile application that connects students with university clubs, societies, and organizations through a single platform. Students can browse events, workshops, hackathons, and club activities, search and filter listings, view details, register, and track their participation status. Club administrators can manage events and student registrations through an admin panel. The app is built using **Flutter (frontend)** and **Django (backend)** with **SQLite** as the database, communicating via HTTP and JSON. The application aims to make campus engagement more accessible, organized, and engaging for all students.

2. Problem Statement

Students often struggle to find suitable campus events, workshops, and club activities because information is scattered across WhatsApp groups, emails, notice boards, and social media. Club administrators face challenges in managing events and registrations manually. **Campus Connect** provides a centralized platform that simplifies event discovery, registration tracking, and club management, making campus engagement more efficient for both students and organizations.

3. Objectives of the Project

1. Develop a centralized platform for students and university clubs
2. Enable students to browse, search, and register for events
3. Allow club administrators to manage events using CRUD operations
4. Store student, event, and registration data in SQLite
5. Provide registration status tracking (Confirmed, Pending, Completed)
6. Build a user-friendly and responsive Flutter mobile app

4. Proposed Methodology / Solution Approach

Campus Connect provides a centralized mobile platform where students can discover and register for campus events, workshops, hackathons, and club activities.

System Roles

Student / Volunteer

- Register & Login
- Browse, search, and filter events
- View details & register
- Track or cancel registrations
- Manage profile

The backend will manage the application data and CRUD operations using Django and Django ORM.

5. Technologies Used

Technology	Purpose
Flutter	Mobile application development
Dart	Programming language
Django	Backend development
SQLite	Database
JSON	Data exchange
Django Media	Profile image handling
Git/GitHub	Version control

6. System Architecture

The system follows a client-server architecture. The Flutter mobile application acts as the client, handling the user interface and user interactions. The Django backend serves as the server, managing business logic, CRUD operations, and database communication. Data is exchanged between the client and server using HTTP requests with JSON format. The Django ORM (Object-Relational Mapping) handles all database operations, communicating with the SQLite database for data storage and retrieval.

7. Expected Outcomes

1. **Easy Event Discovery** – Reduce the difficulty of finding and participating in campus events, workshops, hackathons, and club activities through a centralized platform
2. **Simplified Registration** – Simplify the registration process with one-click registration, instant confirmation, and real-time status tracking
3. **Participation History** – Track participation history and achievements through a dedicated profile section
4. **QR Code Attendance** – Enable quick and efficient check-in using QR code technology

8. Conclusion

Volunteer Connect provides a centralized platform that connects volunteers with NGOs, making opportunity management and volunteer applications simple and efficient. Built with **Flutter**, **Django**, and **SQLite**, the project offers a user-friendly solution and serves as a strong foundation for future enhancements.
